

displayed, a mixture of red and blue colors is displayed. Furthermore, the light passes through the liquid crystals of the two pixel regions with the result that uncontrollable light 135, in which a phase difference cannot be predicted, is generated because the light passes through liquid crystals 103R and 103B and are controlled differently from each other. Consequently, the luminance of a black display will rise, even if the color filter 113R of the R pixel attempts to provide a black display. Naturally, in the case where the light passes through both the color filter 113B and the liquid crystal 103B of the adjacent B pixels like light 136, both of the color mixing and uncontrollable light are simultaneously generated. The degree of such color mixing and the degree of the generation of uncontrollable light become large with an increase in light which traces the same path as the abnormal light 131X described above with the result that the hue reproduction zone is narrowed and the contrast is lowered. The lowering of the contrast becomes more remarkable as the starting point of scattering generated by the scattering plate 125, namely the position where the scattering plate 125 exists becomes distant from the liquid crystal 103.--

IN THE CLAIMS:

Please amend claims 16 and 19, to read as follows:

16. (Amended) A reflection-type color liquid crystal display apparatus comprising:
 - a liquid crystal driving element formation substrate on which a liquid crystal driving element is formed;
 - an opposite substrate which is opposite to said liquid crystal driving element formation substrate;
 - a liquid crystal sandwiched between said liquid crystal driving element formation substrate and said opposite substrate;

a color filter provided on the driving element formation substrate; and
a light scattering mechanism provided at the liquid crystal side surface of the opposite substrate; wherein

said opposite substrate has a transparent insulation substrate; and wherein
said light scattering mechanism comprises an uneven insulation film formed on the surface of the liquid crystal side of the transparent insulation substrate; and wherein
said light scattering mechanism comprises a scattering auxiliary film formed on the uneven insulation film and having a refractive index different from that of the uneven insulation film.

19. (Amended) A reflection-type color liquid crystal display apparatus comprising:
a liquid crystal driving element formation substrate on which a liquid crystal driving element is formed;
an opposite substrate which is opposite to said liquid crystal driving element formation substrate;
a liquid crystal sandwiched between said liquid crystal driving element formation substrate and said opposite substrate;
a color filter provided on the driving element formation substrate; and
a light scattering mechanism provided at the liquid crystal side surface of the opposite substrate; wherein
said opposite substrate has a transparent insulation substrate; and wherein
said light scattering mechanism comprises an uneven insulation film formed on the surface of the liquid crystal side of the transparent insulation substrate; and wherein
